

## **CHEMISTRY**

### **1. INTRODUCTION**

This syllabus is drawn purposely for examination, hence the topics are not necessarily arranged in the order in which they should be taught.

The following assumptions were made in drawing of the syllabus:

- (1) That candidates must have covered the Integrated Science/Basic Science or General Science and Mathematics syllabuses at the Junior Secondary School (JSS)/Junior High School (J.H.S) level;
- (2) That candidates would carry out as many of the suggested activities and project work as possible, and consequently develop the intended competencies and skills as spelt out in the relevant Chemistry teaching syllabuses;
- (3) That schools which offer the subject have well-equipped laboratories.

**Note: Candidates are required to have the knowledge of the significant figures, S.I. units and the conventional/IUPAC system of nomenclature.**

### **2. AIMS**

The aims and objectives of the syllabus are to assess candidates'

- (1) understanding of basic chemistry concepts;
- (2) level of acquisition of laboratory skills including awareness of hazards and safety measures;
- (3) level of awareness of the inter-relationship between chemistry and other discipline;
- (4) level of awareness of the linkage between chemistry and industry/environment/everyday life in terms of benefits and hazards;
- (5) skills of critical and logical thinking.

### **3. EXAMINATION SCHEME**

There shall be three papers - Papers 1, 2 and 3 all of which must be taken. Paper 1 and 2 shall be a composite paper to be taken at one sitting.

**PAPER 1:** Will consist of fifty multiple choice objective questions drawn from Section A of the syllabus (ie the portion of the syllabus which is common to all candidates) . Candidates will be required to answer all the questions within 1 hour for 50 marks.

**PAPER 2:** Will be a 2-hour essay paper covering the entire syllabus and carrying 100 marks. The paper will be in two sections; Sections A and B.

**Section A:** Will consist of ten short structured questions drawn from the common portion of the syllabus. (i.e. Section A of the syllabus). Candidates will be required to answer all the questions for 25 marks.

**Section B:** Will consist of two questions from the common portion of the syllabus (i.e. Section A of the syllabus) and two other questions from the section of the syllabus which is peculiar to the country of the candidate (i.e. either Section B or C of the syllabus). Candidates will be required to answer any three of the questions. Each question shall carry 25 marks.

**PAPER 3:** This shall be a 2-hour practical test for school candidates or 1 hour 30 minutes alternative to practical work test for private candidates. Each version of the paper shall contain three compulsory questions and carry 50 marks.

The questions shall be on the following aspects of the syllabus:

- One question on quantitative analysis;
- One question on qualitative analysis;
- The third question shall test candidates' familiarity with the practical activities suggested in their teaching syllabuses.

**Details of the input into the continuous assessment shall be given by the Council.**

**SECTION A***(For all candidates)*

CONTENT	NOTES
<b>1.0 INTRODUCTION TO CHEMISTRY</b> (a) (i) Measurement of physical quantities.  (ii) Scientific measurements and their importance in chemistry.  (b) Scientific Methods	(1) Measurement of mass, length, time, temperature and volume. (2) Appropriate SI units and significant figures. (3) Precision and accuracy in measurement.  Outline the scientific method to include: Observation, hypothesis, experimentation, formulation of laws and theories.
<b>2.0 STRUCTURE OF THE ATOM</b> (a) Gross features of the atom.	(1) Short account of Dalton's atomic theory and limitations, J.J. Thompson's experiment and Bohr's model of the atom. (2) Outline description of the Rutherford's alpha scattering experiment to establish the structure of the atom.

(b) (i) Atomic number/proton number, number of neutrons, isotopes, atomic mass, mass number.	Meaning and representation in symbols of atoms and sub-atomic particles.
CONTENT	NOTES
(ii) Relative atomic mass ( $A_r$ ) and relative molecular mass ( $M_r$ ) based on Carbon-12 scale.	(1) Atomic mass as the weighted average mass of isotopes. Calculation of relative mass of chlorine should be used as an example. (2) Carbon-12 scale as a unit of measurement. Definition of atomic mass unit.
(iii) Characteristics and nature of matter.	Atoms, molecules and ions. Definition of particles and treatment of particles as building blocks of matter.
(c) Particulate nature of matter: physical and chemical changes.	Explain physical and chemical changes with examples. Physical change- melting of solids, magnetization of iron, dissolution of salt etc. Chemical change- burning of wood, rusting of iron, decay of leaves etc.
(d) (i) Electron Configuration	Detailed electron configurations (s,p,d) for atoms of the first thirty elements.
(ii) Orbitals	Origin of s,p and d orbitals as sub-energy levels; shapes of s and p orbitals only.
(iii) Rules and principles for filling in electrons.	(1) Aufbau Principle, Hund's Rule of Maximum Multiplicity and Pauli Exclusion Principle. (2) Abbreviated and detailed electron

	configuration in terms of s, p, and d.
CONTENT	NOTES
<b>3.0 STANDARD SEPARATION TECHNIQUES FOR MIXTURES</b> <p>(a) Classification of mixtures.</p> <p>(b) Separation techniques</p> <p>(c) Criteria for purity.</p> <b>4.0 PERIODIC CHEMISTRY</b> <p>(a) Periodicity of the elements.</p> <p>(b) Different categories of elements in the periodic table.</p> <p>(c) Periodic law:</p> <p>(i) Trends on periodic table;</p>	<p>Solid-solid, solid-liquid, liquid-liquid, gas-gas with examples.</p> <p>Crystallization, distillation, precipitation, magnetization, chromatography, sublimation etc.</p> <p>Boiling point for liquids and melting point for solids.</p> <p>Electron configurations leading to group and periodic classifications.</p> <p>Metals, semi-metals, non-metals in the periodic table and halogens. Alkali metals, alkaline earth metals and transition metals as metals.</p> <p>Explanation of the periodic law.</p> <p>Periodic properties; atomic size, ionic size, ionization energy, electron affinity and electronegativity.</p> <p>Simple discrepancies should be accounted</p>

(ii) Periodic gradation of the elements in the third period (Na - Ar).	<p>for in respect to beryllium, boron, oxygen and nitrogen.</p> <p>(1) Progression from:</p> <ul style="list-style-type: none"> <li>(i) metallic to non-metallic character of element;</li> <li>(ii) ionic to covalent bonding in compounds.</li> </ul>
CONTENTS	NOTES
<p>(d) Reactions between acids and metals, their oxides and trioxocarbonates (IV).</p> <p>(e) Periodic gradation of elements in group seven, the halogens: F, Cl, Br and I.</p> <p>(f) Elements of the first transition series.  <math>_{21}\text{Sc} - _{30}\text{Zn}</math></p>	<p>(2) Differences and similarities in the properties between the second and the third period elements should be stated.</p> <p>(1) Period three metals (Na, Mg, Al).            (2) Period four metals (K, Ca).            (3) Chemical equations.            (4) pH of solutions of the metallic oxides and trioxocarbonates.</p> <p>Recognition of group variations noting any anomalies.            Treatment should include the following:</p> <ul style="list-style-type: none"> <li>(a) physical states, melting and boiling points;</li> <li>(b) variable oxidation states;</li> <li>(c) redox properties of the elements;</li> <li>(d) displacement reaction of one halogen by another;</li> <li>(e) reaction of the elements with water and alkali (balanced equations required).</li> </ul> <p>(1) Their electron configurations, physical properties and chemical reactivity of the elements and their compounds.</p> <p>(2) Physical properties should include:</p>

	<p>physical states, metallic properties and magnetic properties.</p> <p>(3) Reactivity of the metals with air, water, acids and comparison with s-block elements (Li, Na, Be, Mg).</p>
CONTENT	NOTES
<p><b>5.0 CHEMICAL BONDS</b></p> <p>(a) Interatomic bonding</p> <p>(b) (i) Formation of ionic bonds and compounds.</p> <p>(ii) Properties of ionic compounds.</p> <p>(c) Naming of ionic compounds.</p>	<p>(4) Other properties of transition metals should include:</p> <ul style="list-style-type: none"> <li>(a) variable oxidation states;</li> <li>(b) formation of coloured compounds;</li> <li>(c) complex formation;</li> <li>(d) catalytic abilities;</li> <li>(e) paramagnetism;</li> <li>(f) hardness.</li> </ul> <p>Meaning of chemical bonding. Lewis dot structure for simple ionic and covalent compounds.</p> <p>Formation of stable compounds from ions. Factors influencing formation: ionization energy; electron affinity and electronegativity difference.</p> <p>Solubility in polar and non-polar solvents, electrical conductivity, hardness and melting point.</p> <p>IUPAC system for simple ionic compounds.</p>

<p>(d) Formation of covalent bonds and compounds.</p> <p>(e) (i) Properties of covalent compounds.</p> <p>(ii) Coordinate (dative) covalent bonding.</p>	<p>Factors influencing covalent bond formation. Electron affinity, ionization energy, atomic size and electronegativity.</p> <p>Solubility in polar and non-polar solvents, melting point, boiling point and electrical conductivity.</p> <p>Formation and difference between pure covalent and coordinate (dative) covalent bonds.</p>
CONTENT	NOTES
<p>(f) Shapes of molecular compounds.</p> <p>(g) (i) Metallic Bonding</p> <p>(ii) Factors influencing its formation.</p> <p>(iii) Properties of metals.</p> <p>(h) (i) Inter molecular bonding</p> <p>(ii) Intermolecular forces in covalent compounds.</p> <p>(iii) Hydrogen bonding</p>	<p>Linear, planar, tetrahedral and shapes for some compounds e.g. <math>\text{BeCl}_2</math>, <math>\text{BF}_3</math>, <math>\text{CH}_4</math>, <math>\text{NH}_3</math>, <math>\text{CO}_2</math>.</p> <p>Factors should include: atomic radius, ionization energy and number of valence electrons. Types of specific packing not required.</p> <p>Typical properties including heat and electrical conductivity, malleability, lustre, ductility, sonority and hardness.</p> <p>Relative physical properties of polar and non-polar compounds.</p> <p>Description of formation and nature should be treated.</p> <p>Dipole-dipole, induced dipole-dipole, induced dipole-induced dipole forces should be treated under van der Waal's forces.</p> <p>Variation of the melting points and boiling points of noble gases, halogens and alkanes in the homologous series</p>

<p>(iii) van der Waals forces</p> <p>(iv) Comparison of all bond types.</p>	<p>explained in terms of van der Waal's forces; and variation in the boiling points of <math>H_2O</math>, and <math>H_2S</math> explained using Hydrogen bonding.</p>
CONTENT	NOTES
<p><b>6.0 STOICHIOMETRY AND CHEMICAL REACTIONS</b></p> <p>(a) (i) Symbols, formulae and equations.</p> <p>(ii) chemical symbols</p> <p>(iii) Empirical and molecular formulae.</p> <p>(iv) Chemical equations and IUPAC names of chemical compounds.</p> <p>(v) Laws of chemical combination.</p>	<p>Symbols of the first thirty elements and other common elements that are not among the first thirty elements.</p> <p>Calculations involving formulae and equations will be required. Mass and volume relationships in chemical reactions and the stoichiometry of such reactions such as: calculation of percentage composition of element.</p> <p>(1) Combustion reactions (including combustion of simple hydrocarbons)</p> <p>(2) Synthesis</p> <p>(3) Displacement or replacement</p> <p>(4) Decomposition</p> <p>(5) Ionic reactions</p> <p>(1) Laws of conservation of mass.</p> <p>(2) Law of constant composition.</p> <p>(3) Law of multiple proportions.</p> <p>Explanation of the laws to balance</p>

<p>(b) Amount of substance.</p> <p style="text-align: center;"><b>CONTENT</b></p>	<p>given equations.</p> <p>(4) Experimental illustration of the law of conservation of mass.</p> <p>(1) Mass and volume measurements.</p> <p>(2) The mole as a unit of measurement; Avogadro's constant, <math>L = 6.02 \times 10^{23}</math> entities <math>\text{mol}^{-1}</math>.</p> <p>(3) Molar quantities and their uses.</p> <p>(4) Moles of electrons, atoms, molecules, formula units etc.</p> <p style="text-align: center;"><b>NOTES</b></p>
<p>(c) Mole ratios</p> <p>(d) (i) Solutions</p> <p>(ii) Concentration terms</p> <p>(iii) Standard solutions.</p>	<p>Use of mole ratios in determining stoichiometry of chemical reactions. Simple calculations to determine the number of entities, amount of substance, mass, concentration, volume and percentage yield of product.</p> <p>(1) Concept of a solution as made up of solvent and solute.</p> <p>(2) Distinguishing between dilute solution and concentrated solution.</p> <p>(3) Basic, acidic and neutral solutions.</p> <p>Mass (g) or moles (mol) per unit volume. Emphasis on current IUPAC chemical terminology, symbols and conventions. Concentration be expressed as mass concentration, <math>\text{g dm}^{-3}</math>, molar concentration, <math>\text{mol dm}^{-3}</math>.</p> <p>(1) Preparation of some primary standards e.g anhydrous <math>\text{Na}_2\text{CO}_3</math>, <math>(\text{COOH})_2</math>, <math>2\text{H}_2\text{O}/\text{H}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}</math>.</p> <p>(2) Meaning of the terms primary standard, secondary standard and</p>

<p>(e) Preparation of solutions from liquid solutes by the method of dilution.</p>	<p>standard solution.</p> <p>Dilution factor</p>
CONTENT	NOTES
<p><b>7.0 STATES OF MATTER</b></p> <p>(a) (i) Kinetic theory of matter.</p> <p>(ii) Changes of state of matter.</p>	<p>(1) Postulates of the kinetic theory of matter.</p> <p>(2) Use of the kinetic theory to explain the following processes: melting of solids, boiling of liquids, evaporation of liquids, dissolution of solutes, Brownian motion and diffusion.</p> <p>(1) Changes of state of matter should be explained in terms of movement of particles. It should be emphasized that randomness decreases (and orderliness increases) from gaseous state to liquid state and to solid state and vice versa.</p> <p>(2) Illustrations of changes of state using the different forms of water, iodine, sulphur, naphthalene etc.</p> <p>(3) Brownian motion to be illustrated using any of the following experiments:</p> <p>(a) pollen grains/powdered sulphur in water (viewed under a microscope);</p> <p>(b) smoke in a glass container illuminated by a strong light from the side;</p>

<p>(iii) Diffusion</p> <p style="text-align: center;"><b>CONTENT</b></p>	<p>(c) a dusty room being swept and viewed from outside under sunlight.</p> <p>(1) Experimental demonstration of diffusion of two gases.</p> <p>(2) Relationship between speed at which different gas particles move and the masses of particles.</p> <p>(3) Experimental demonstration of diffusion of solute particles in liquids.</p> <p style="text-align: center;"><b>NOTES</b></p>
<p>(b) Gases:</p> <p>(i) Characteristics and nature of gases;</p> <p>(ii) The gas laws;</p> <p>(iii) Laboratory preparation and properties of some gases.</p>	<p>Arrangement of particles, density, shape and compressibility.</p> <p>The Gas laws: Charles'; Boyle's; Dalton's law of partial pressure; Graham's law of diffusion, Avogadro's law. The ideal gas equation of state. Qualitative explanation of each of the gas laws using the kinetic model. The use of Kinetic molecular theory to explain changes in gas volumes, pressure, temperature. Mathematical relations of the gas law <math>PV = nRT</math> Ideal and Real gases Factors responsible for the deviation of real gases from ideal situation.</p> <p>(1) Preparation of the following gases: <math>H_2</math>, <math>NH_3</math> and <math>CO_2</math>. Principles of purification and collection of gases.</p> <p>(2) Physical and chemical properties of</p>

<p>(c) (i) Liquids</p> <p>(ii) Vapour and gases.</p> <p style="text-align: center;"><b>CONTENT</b></p>	<p>the gases.</p> <p>Characteristics and nature of liquids based on the arrangement of particles, shape, volume, compressibility, density and viscosity.</p> <ol style="list-style-type: none"> <li>(1) Concept of vapour, vapour pressure, saturated vapour pressure, boiling and evaporation.</li> <li>(2) Distinction between vapour and gas.</li> <li>(3) Effect of vapour pressure on boiling points of liquids.</li> <li>(4) Boiling at reduced pressure.</li> </ol> <p style="text-align: center;"><b>NOTES</b></p>
<p>(d) Solids:</p> <p>(i) Characteristics and nature;</p> <p>(ii) Types and structures;</p> <p>(iii) Properties of solids.</p> <p>(e) Structures, properties and uses of diamond and graphite.</p> <p>(f) Determination of melting points of covalent solids.</p>	<ol style="list-style-type: none"> <li>(1) Ionic, metallic, covalent network and molecular solids. Examples in each case.</li> <li>(2) Arrangements of particles ions, molecules and atoms in the solid state.</li> </ol> <p>Relate the properties of solids to the type of interatomic and intermolecular bonding in the solids. Identification of the types of chemical bonds in graphite and differences in the physical properties.</p> <p>The uses of diamond and graphite related to the structure.</p> <p>The use of iodine in everyday life.</p> <p>Melting points as indicator of purity of solids e.g. Phenyl methanedioic acid (benzoic acid), ethanedioic acid (oxalic)</p>

<p><b>8.0 ENERGY AND ENERGY CHANGES</b></p> <p>(a) Energy and enthalpy</p> <p>(b) Description, definition and illustrations of energy changes and their effects.</p> <p style="text-align: center;"><b>CONTENT</b></p>	<p>and ethanamide.</p> <p>Explanation of the terms energy and enthalpy. Energy changes associated with chemical processes.</p> <p>(1) Exothermic and endothermic processes.</p> <p>(2) Total energy of a system as the sum of various forms of energy e.g. kinetic, potential, electrical, heat, sound etc.</p> <p>(3) Enthalpy changes involved in the following processes: combustion, dissolution and neutralization.</p> <p style="text-align: center;"><b>NOTES</b></p>
<p><b>9.0 ACIDS, BASES AND SALTS</b></p> <p>(a) Definitions of acids and bases.</p> <p>(b) Physical and chemical properties of acids and bases.</p> <p>(c) Acids, bases and salts as electrolytes.</p>	<p>(1) Arrhenius concepts of acids and bases in terms of <math>\text{H}_3\text{O}^+</math> and <math>\text{OH}^-</math> ions in water.</p> <p>(2) Effects of acids and bases on indicators, metal Zn, Fe and trioxocarbonate (IV) salts and hydrogentrioxocarbonate (IV) salts.</p> <p>Characteristic properties of acids and bases in aqueous solution to include:</p> <p>(a) conductivities, taste, litmus/indicators, feel etc.;</p> <p>(b) balanced chemical equations of all reactions.</p> <p>Electrolytes and non-electrolytes; strong and weak electrolytes. Evidence from conductivity and enthalpy of neutralization.</p>

15

<p>(g) Deliquescent, efflorescent and hygroscopic compound.</p> <p>(h) Acid-Base indicators</p> <p>(i) Acid-Base titration</p> <p style="text-align: center;"><b>CONTENT</b></p>	<p>group 3 and the d-block element.</p> <p>Use of hygroscopic compounds as drying agent should be emphasized.</p> <p>(1) Qualitative description of how acid-base indicator works.</p> <p>(2) Indicators as weak organic acids or bases (organic dyes).</p> <p>(3) Colour of indicator at any pH dependent on relative amounts of acid and forms.</p> <p>(4) Working pH ranges of methyl orange and phenolphthalein.</p> <p>(1) Knowledge and correct use of relevant apparatus.</p> <p>(2) Knowledge of how acid-bases indicators work in titrations.</p> <p style="text-align: center;"><b>NOTES</b></p>
<p><b>10.0 SOLUBILITY OF SUBSTANCES</b></p> <p>(a) General principles</p>	<p>(3) Acid-base titration experiments involving HCl, HNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub> and NaOH, KOH, Ca(OH)<sub>2</sub>, CO<sub>3</sub><sup>2-</sup>, HCO<sub>3</sub><sup>-</sup>.</p> <p>(4) Titration involving weak acids versus strong bases, strong acids versus weak bases and strong acids versus strong bases using the appropriate indicators and their applications in quantitative determination; e.g. concentrations, mole ratio, purity, water of crystallization and composition.</p> <p>(1) Meaning of Solubility.</p> <p>(2) Saturated and unsaturated solutions.</p> <p>(3) Saturated solution as an equilibrium</p>

<p>(b) Practical application of solubility.</p>	<p>system.</p> <ol style="list-style-type: none"> <li>(4) Solubility expressed in terms of: mol dm<sup>-3</sup> and g dm<sup>-3</sup> of solution/solvent.</li> <li>(5) Solubility curves and their uses.</li> <li>(6) Effect of temperature on solubility of a substance.</li> <li>(7) Relationship between solubility and crystallization.</li> <li>(8) Crystallization/recrystallization as a method of purification.</li> <li>(9) Knowledge of soluble and insoluble salts of stated cations and anions.</li> <li>(10) Calculations on solubility.</li> </ol> <p>Generalization about solubility of salts and their applications to qualitative analysis. e.g. Pb<sup>2+</sup>, Ca<sup>2+</sup>, Al<sup>3+</sup>, Cu<sup>2+</sup>, Fe<sup>2+</sup>, Fe<sup>3+</sup>, Cl<sup>-</sup>, Br<sup>-</sup>, I<sup>-</sup>, SO<sub>4</sub><sup>2-</sup>, S<sup>2-</sup>, and CO<sub>3</sub><sup>2-</sup>, Zn<sup>2+</sup>, NH<sub>4</sub><sup>+</sup>, SO<sub>3</sub><sup>2-</sup></p> <p>Explanation of solubility rules.</p>
CONTENT	NOTES
<p><b>11.0 CHEMICAL KINETICS AND EQUILIBRIUM SYSTEM</b></p> <p>(a) Rate of reactions:</p> <p>(i) Factors affecting rates;</p> <p>(ii) Theories of reaction rates;</p>	<ol style="list-style-type: none"> <li>(1) Definition of reaction rate.</li> <li>(2) Observable physical and changes: colour, mass, temperature, pH, formation of precipitate etc.</li> </ol> <ol style="list-style-type: none"> <li>(1) Physical states, concentration/pressure of reactants, temperature, catalysts, light, particle size and nature of reactants.</li> <li>(2) Appropriate experimental demonstration for each factor is required.</li> </ol> <ol style="list-style-type: none"> <li>(1) Collision and transition state theories to be treated qualitatively only.</li> </ol>

<p>(iii) Analysis and interpretation of graphs.</p> <p>(b) Equilibrium:</p> <p>(i) General Principle;</p>	<p>(2) Factors influencing collisions: temperature and concentration.</p> <p>(3) Effective collision.</p> <p>(4) Activation energy.</p> <p>(5) Energy profile showing activation energy and enthalpy change.</p> <p>Drawing of graphs and charts.</p> <p>Explanation of reversible and irreversible reactions. Reversible reaction i.e. dynamic equilibrium. Equilibrium constant K must be treated qualitatively. It must be stressed that K for a system is constant at constant temperature.</p> <p>Simple experiment to demonstrate reversible reactions.</p>
CONTENT	NOTES
<p>(ii) Le Chatelier's principle.</p> <p><b>12.0 REDOX REACTIONS</b></p> <p>(a) Oxidation and reduction process.</p>	<p>Prediction of the effects of external influence of concentration, temperature pressure and volume changes on equilibrium systems.</p> <p>(1) Oxidation and reduction in terms of:</p> <p>(a) addition and removal of oxygen and hydrogen;</p> <p>(b) loss and gain of electrons;</p> <p>(c) change in oxidation numbers/states.</p> <p>(2) Determination of oxidation numbers/states.</p>

## SECTION B

*(For candidates in Ghana only)*

CONTENTS	NOTES
<p><b>1.0 STRUCTURE OF THE ATOM</b></p> <p>(a) Elementary treatment of mass spectrometer.</p>	<p>(1) Qualitative knowledge of the mass spectrometer: principles and operations of the mass spectrometer; and its use to detect isotopes, determination of Relative atomic and molecular masses only.</p> <p>(2) Wave nature of electrons.</p> <p>(3) Quantum numbers and their importance.</p>

<p>(b) (i) Nuclear chemistry</p> <p>(ii) Types and nature of radiations: alpha, beta particles and gamma radiation.</p> <p>(iii) Radioactivity: induced/stimulated.</p> <p>(iv) Nuclear reactions: fission and fusion in nuclear reactions.</p> <p>(v) Effects and application of radioactivity</p> <p><b>2.0 PERIODIC CHEMISTRY</b></p> <p>(a) Reactions between acids and metals their oxides and trioxocarbonates (IV).</p>	<p>Meaning of terms: Nucleons, nuclide.</p> <p>Charges, relative mass and penetrating power of radiations. Meaning of radioactivity. Difference between spontaneous nuclear reactions (radioactivity) and induced nuclear reactions.</p> <p>Natural and artificial radioactivity. Detection of radiation by Geiger-Muller counter.</p> <p>Distinction between ordinary chemical reactions and nuclear reactions. Generations of electricity; atomic bombs. Balanced equations of nuclear reactions</p> <p>(1) Carbon dating (qualitative treatment only). (2) Use of radioactivity in agriculture, medicine and industries. (3) Hazards associated with nuclear radiations.</p> <p>Factors affecting stability of nuclides: Binding energy, neutron-proton ratio, and half life. Calculations involving half-life</p> <p>(1) Period three metals (Na, Mg, Al) (2) Period four metals (K, Ca) (3) Chemical equations (4) pH of solutions of the metallic oxides and trioxocarbonates.</p>
CONTENTS	NOTES
<p>(b) Acidic properties of oxides of non-metals.</p> <p>(c) Physical and chemical properties of period 3 elements and their compounds.</p>	<p>(1) Oxides of carbon, nitrogen, sulphur, phosphorus and chlorine. (2) pH of aqueous solutions of the oxides. (3) Chemical equations.</p> <p>(1) Comparison of the physical and chemical properties of period three elements. (2) Comparison of the physical and chemical properties of (hydrides, oxides, hydroxides and chlorides) compounds.</p>

<p>(d) Silicon</p> <p>(e) Periodic gradation of elements in group seven i.e. the halogens.</p> <p>(f) Bonding in complex compounds.</p> <p>(g) Shapes of complex compounds.</p> <p>(h) Elements of the first transition series.</p> <p><b>3.0. CHEMICAL BONDS</b></p> <p>(a) Formation of Ionic bonds:</p> <p>(i) Factors that influence ionic bond formation;</p>	<p>(3) Thermal stability of <math>\text{CO}_3^{2-}</math> and <math>\text{NO}_3^-</math> of Li, Na, K, Mg and Ca.</p> <p>(4) Experiment to compare thermal stability of <math>\text{Na}_2\text{CO}_3/\text{LiCO}_3/\text{CuSO}_4</math>.</p> <p>(1) Structures for <math>\text{SiO}_2</math> and <math>\text{CO}_2</math> account for the differences between physical and chemical properties of the two oxides.</p> <p>(2) Uses of silicon and its compounds e.g. ceramics, glass, silica gel and microchips.</p> <p>(1) Inter- atomic bond energies.</p> <p>(2) Hydrides and their acid strength comparison of the <math>K_a</math> values of the hydrogen halides.</p> <p>(3) Variable oxidation states of the halogens.</p> <p>Definition of ligands and central ions</p> <p>Examples of ligands</p> <p>(1) Formation of coordination compounds.</p> <p>(2) Nomenclature of complex ions and compounds (<math>\text{Cl}^-</math>, <math>\text{F}^-</math>, <math>\text{I}^-</math>, <math>\text{NO}_3^-</math>, <math>\text{NH}_3</math>, <math>\text{H}_2\text{O}</math>, <math>\text{SO}_4^{2-}</math>).</p> <p>Tetrahedral, square planar, octahedral e.g. <math>(\text{Fe}(\text{CN})_6)^{3-}</math>, <math>[\text{Cu}(\text{NH}_3)_4]^{2+}</math>, <math>[\text{Ag}(\text{NH}_3)_2]^+</math> <math>[\text{Cu}(\text{CN})_4]^{2-}</math></p> <p>Reactivity of the metals with air, water, acids and comparison with s-block elements (Li, Na, Be, Mg).</p> <p>Factors should include lattice energy.</p>
CONTENTS	NOTES
<p>(ii) Covalent character in ionic bond;</p> <p>(iii) Polar covalent bonds.</p> <p>(b)(i) Hybridization of atomic orbitals.</p>	<p>(1) Ionic character (polarity) in covalent bonds based on electronegativity difference between the species involved.</p> <p>(2) Effects of covalent and ionic character in ionic and covalent bonds on the solubility, thermal stability and boiling points of ionic and covalent compounds.</p> <p>Definition of Hybridization.</p>

<p>(ii) Formation of hybrid orbitals.</p> <p>(iii) Formation of sigma (<math>\sigma</math>) and pi (<math>\pi</math>) bonds.</p> <p><b>4.0 SOLUTIONS</b></p> <p>(a) Preparation of solutions from liquid solutes by the method of dilution.</p> <p><b>5.0 ENERGY AND ENERGY CHANGES</b></p> <p>(a) Energy changes in physical and isolated systems.</p> <p>(b) Hess's Law of heat summation and Born-Haber cycle.</p>	<p>(1) Description of <math>sp</math>, <math>sp^2</math>, <math>sp^3</math> hybrid orbitals.</p> <p>(2) Shapes of <math>sp</math>, <math>sp^2</math>, <math>sp^3</math> and <math>sp^3d^2</math> hybrid orbitals. Treatment should be limited to the following molecules only. <math>CH_4</math>, <math>H_2O</math>, <math>NH_3</math>, <math>BCl_3</math>, <math>C_2H_2</math>, <math>BeCl_2</math>, <math>C_2H_4</math> and <math>SF_6</math>.</p> <p>Description of sigma and pi bonds. Using <math>C_2H_2</math> and <math>C_6H_6</math>.</p> <p>(1) Outline of steps involved in the preparation of solutions from liquid solutes.</p> <p>(2) Determination of concentration of liquid solutes (stock solution) given the density, w/v, w/w), specific gravity, relative molecular mass, molar mass, and % purity.</p> <p>(3) Primary standard, secondary standard and standardized solution.</p> <p>(1) Definition and understanding of the meaning of the energy terms: systems, surroundings, open and closed.</p> <p>(2) Enthalpy change involved in the following processes: combustion, atomization, sublimation, hydration/solvation and dissolution.</p> <p>Explanation of Hess's law and its application in the development of the Born-Haber cycle.</p> <p>(1) Use of difference cycles to illustrate Hess's law.</p>
CONTENTS	NOTES
<p>(c) Bond Energy</p>	<p>(2) Simple calculations using chemical equations, energy cycles or diagrams with given energy changes.</p> <p>Explanation of bond energy and bond dissociation energy.</p> <p>(1) Bond energy as an average value. Differences in bond energy and bond dissociation energy.</p>

<p><b>6.0 ACIDS, BASES AND SALTS</b></p> <p>(a) Definitions of acids and bases.</p> <p>(b) pH, pOH and <math>pK_w</math></p> <p>(c) Partial ionization of weak acids and weak bases.</p> <p>(d) Buffer Solutions</p>	<p>(2) Bond energy in molecules and its use in assessment of bond strength, energy content and enthalpy of reaction.</p> <p>(3) Calculations using summation of bond energies in reactants and products as a measure of enthalpy of reaction.</p> <p>(1) Bronsted – Lowry and Lewis concept of acids and bases.</p> <p>(2) Conjugate acid-base pair concept in terms of equilibrium.</p> <p>(1) Ionic product constant of water <math>K_w = [H^+_{(aq)}][OH^-_{(aq)}] = 1.0 \times 10^{-14} \text{ mol}^2\text{dm}^{-6}</math>.</p> <p>(2) pH and pOH as a measure of acidity and alkalinity respectively <math>pH = -\log[H_3O^+]</math>.</p> <p>(3) Knowledge of pH scale.</p> <p>(4) Calculation of <math>[H^+]</math>, <math>[OH^-]</math> and the corresponding pH and pOH of given solutions.</p> <p>Explanation of <math>pK_a</math> and <math>pK_b</math> of weak acids and bases.</p> <p>(1) Behaviour of weak acids and weak bases in water as example of equilibrium systems.</p> <p>(2) Calculations involving <math>K_a</math>, <math>pK_a</math> and <math>K_b</math>, <math>pK_b</math>.</p> <p>(3) <math>K_a</math>, <math>pK_a</math> and <math>K_b</math>, <math>pK_b</math> as measurements of acid and basic strengths respectively.</p> <p>(1) Qualitative definition of buffers.</p> <p>(2) Examples of buffers from the laboratory.</p> <p>(3) Preparation of buffer solutions.</p>
CONTENTS	NOTES
<p>(e) Acid base titrations</p>	<p>Double indicator titrations (continuous and Discontinuous) and back titration.</p> <p>Calculations involving concentration, composition and % purity.</p> <p>Graphs for acid-based titrations. Nature of graphs of strong acid and strong base, strong acid and weak base and strong base and weak acid.</p>

compounds.  (e) Reactivity of iron and aluminium with air, water and acids. (f) Properties and uses of copper and its compounds.	$\text{CaCO}_3$ , $\text{CaO}$ , $\text{CaSO}_4$ , $\text{CaCl}_2$ , and $\text{Ca(OH)}_2$  The compounds must be limited to $\text{CuSO}_4$ , $\text{CuO}$ and $\text{CuCl}_2$ .
---	---

## **.16.0 PRACTICALS**

### **(a) GENERAL SKILLS AND PRINCIPLES**

Candidates will be expected to be familiar with the following skills and principles:

- (i) Measurement of mass and volume;
- (ii) Preparation and dilution of standard solutions;
- (iii) Filtration, recrystallisation and melting point determination;

- (iv) Measurement of heats of neutralization and solutions;
- (v) Determination of pH value of various solutions by colorimetry;
- (vi) Determination of rates of reaction from concentration versus time curves;
- (vii) Determination of equilibrium constants for simple system.

## **(b) QUANTITATIVE ANALYSIS**

### **Acid-base titrations**

The use of standard solutions of acids and alkalis and the indicators; methyl orange, methyl red and phenolphthalein to determine the following:

- (i) The concentrations of acid and alkaline solutions;
- (ii) The molar masses of acids and bases and water of crystallization.
- (iii) The solubility of acids and bases;
- (iv) The percentage purity of acids and bases;
- (v) Analysis of  $\text{Na}_2\text{CO}_3/\text{NaHCO}_3$  mixture by double indicator methods (Ghanaians only).
- (vi) Stoichiometry of reactions.

### **Redox titrations**

Titration of the following systems to solve analytical problems:

- (i) Acidic  $\text{MnO}_4^-$  with  $\text{Fe}^{2+}$ ;
- (ii) Acidic  $\text{MnO}_4^-$  with  $\text{C}_2\text{O}_4^{2-}$ ;
- (iii)  $\text{I}_2$  in KI versus  $\text{S}_2\text{O}_3^{2-}$ .

## **(d) QUALITATIVE ANALYSIS**

No formal scheme of analysis is required.

- (i) Characteristic tests of the following cations with dilute  $\text{NaOH}_{(\text{aq})}$  and  $\text{NH}_3_{(\text{aq})}$ ;

$\text{NH}_4^+$ ;  $\text{Ca}^{2+}$ ;  $\text{Pb}^{2+}$ ;  $\text{Cu}^{2+}$ ;  $\text{Fe}^{2+}$ ;  $\text{Fe}^{3+}$ ;  $\text{Al}^{3+}$ ; and  $\text{Zn}^{2+}$ .

- (ii) Confirmatory tests for the above cations.
- (iii) Characteristic reaction of dilute HCl on solids or aqueous solutions and conc.  $\text{H}_2\text{SO}_4$  on solid samples of the following:  
 $\text{Cl}^-$ ;  $\text{SO}_3^{2-}$ ;  $\text{CO}_3^{2-}$ ;  $\text{NO}_3^-$  and  $\text{SO}_4^{2-}$ .
- (iv) Confirmatory tests for the above anions
- (v) Comparative study of the halogens; displacement reactions.
- (vi) Characteristic tests for the following gases:  $\text{H}_2$ ;  $\text{NH}_3$ ;  $\text{CO}_2$ ; HCl and  $\text{SO}_2$ .
- (vii) Characteristic test tube reactions of the functional groups in the following simple organic compounds: Alkenes; alkanols; alkanoic acids, sugars (using Fehling's and Benedict's solutions only); starch (iodine test only) and proteins (using the Ninhydrin test, Xanthoproteic test, Biuret test and Millon's test only).
